

912-AVA

Operation

The 912-AVA is a simple alarm module that is designed to alert personnel that a cylinder has reached a point that requires attention. The alarm module comes complete with a red warning light and an audible alarm. There is a silence button on this model to silence the audible alarm. The red warning light will remain lit until a new cylinder has been installed

Installation

Attach the 912-AVA to a wall or other structure using the mounting tabs located diagonally across from each other on the exterior of the alarm. **DO NOT** open the alarm module and try to fasten the housing by screwing through the enclosure. Doing so will void all warranties.

Next connect the leads from your pressure switch to the terminal block on the bottom of the alarm module. Polarity is not an issue. Wiring should be done in compliance with all state & local codes.

Once all connections have been made plug the 120vac adapter into the jack on the side of the module and into a standard 120vac outlet. If there is a full cylinder connected and open on the system only the small green power light will be lit at the top of the module. If no cylinder is connected or opened the unit will go into alarm.
